

ABSTRACT OF THE DISCLOSURE

An original inputted to an original inputting unit is divided to morphemes. A sequence of the divided morphemes is converted to conceptual categories. A typical sentence verifying unit verifies whether
5 or not a string of predetermined conceptual categories exists in the sequence of the converted conceptual categories. When the string of predetermined conceptual categories exists in the sequence of the converted conceptual categories, a replacing unit generates a pattern of a
predetermined translated sentence corresponding to the string of the
10 conceptual categories and replaces the pattern of the predetermined translated sentence with translated words corresponding to the original morphemes of the conceptual categories constituting the pattern of the translated sentence.
